

Automation Setup Instructions

To validate the automation scripts we need to do the environment setup. Follow the steps below to set up the environment.

Automation Setup steps:

1. Download the Eclipse from the site "<https://www.eclipse.org/downloads/>"
2. Install the Eclipse application from the downloaded file.
3. Verify the Java installed in the Desktop
4. Download the jar files from the site "<https://www.selenium.dev/downloads/>"
5. Download the suitable Browser from Selenium site
6. Setup the TestNG from the eclipse Marketplace.

To run this sample script follow the below steps.

7. Run the java eclipse
8. Choose the workspace to run the project.
9. Import the Amazon project "select File -> Open new project from system"
10. Now add the jar files to project -> right click on the project-> select Build path -> Configure build path -> choose Libraries-> click Add External JARs -> choose the Files from system -> apply and close button

Project Execution steps:

11. Choose the Main Class Package-> Select **main class** to Run the scripts.
12. Click on the run icon and choose the TestNG suite to run the main class so that the script will run in TestNg framework.
13. After the Scripts run successfully you can find the Pass results in the eclipse console.
